

Quantum Energised Water

What is really wrong with our water, today? More and more people are hearing the expression, "our tap water is dead water". It's common knowledge, of course, that our waterways, lakes, reservoirs and running water supplies are polluted willfully and unintentionally through mankind's many activities, habits and technologies. We already know much about the health risks of chlorinated drinking water, dangers that became more widely acknowledged as we approached the end of the last millennium. Yet, still, little is commonly

known about the actual energised forces at work in clean, naturally flowing, vibrant water; which enables it to so effectively perform its functions. Before we explore further, let us remind the reader of an underlying essential function of water.

An Essential Function of Water

One of the primary functions of water at a cellular level is to carry nutrients to organisms and to efficiently carry away and dilute waste products. Water has also been referred to as "nature's universal solvent". It is needed by all life forms and ecologies, and by every major sustaining activity and industry of mankind.

In times past, water was deeply respected, often revered, as the essential fluid to all life - in the stages of conception, birth, growth, and sustenance, and to the healing of disease. Many naturalists, healers and scientists have spent their lives consuming studies of the properties and essence of water – however, depending upon the breadth of their perception of the universal order of things, this has resulted in many conflicting and confusing schools of belief on the definition of truly healthy water.

What is Energised Water?

Energised water is 'alive' water, a living, functioning organism in itself. Tests with an Ohmmeter have shown that 'alive' water increases the energy level in the body of someone who has just been consuming such water. Photographs of the photon activity in water display a dramatic increase in the luminescence or light output once the water has been treated with Quantum Pendant. This increases photosynthesis (energy) in life forms that take up this water. Mankind has largely failed to understand this essential quality of health-giving, totally functioning water.

Energised water is water that has been given a highly orderly structure by natural magnetic forces found within the earth and from planetary magnetic forces, and is allowed to come to the Earth's surface via its preferred, natural pathways - in mountain springs, clean, natural rivers, naturally-occurring wells, and suchlike. Water always flows in an inwardly spiralling fashion whenever it can - in a vortex or implosion course. Whether surface-flowing or underground, non-manipulated water seeks its natural course - the path of least resistance and the path of maximum nutrition; witness the flow of a river as it moves in a serpentine fashion. The great natural scientist and thinker, Viktor Schauberger of Austria had the title "The Water Wizard" bestowed upon him for his groundbreaking observations as to the true nature and inherent functions of water – the secrets of the vortex.

When we drink or wash in this fresh, clear water from these unadulterated sources, we feel refreshed and very energised. There have been countless healing effects observed and documented in respect to many natural springs and rivers found all around the globe. Examples are the waters of Lourdes and the Ganges River (regardless of its seemingly polluted state!), Fatima and Medjugorje. Photographs of the photon emissions and molecular clusters of these waters show an intensely active, light-filled and cohesive structure in all cases.

Quantum-energised water is potentised, cohesive water. The dynamic forces programmed for action within energised water may be transferred to living beings (man, animal or plant life). These dynamics are to be found not in the chemical structure of this water, but in its physical structure, on the level of its molecule groups.

The quality of water is derived from its physical structure, its underlying geometry and the frequencies that it has stored. As a result of the special physical parameters of energised water, various reaction processes producing positive effects are made possible. These many beneficial effects allow the widest conceivable possibilities of application, such as the re-energising of damaged water supplies. To fully understand what is meant by the term "damaged" water, we must first understand certain fundamental principles about the activity in water at the molecular level.

Subtle Energy Vibrations in Energised Water, Resonance and Memory of Water

We have mentioned above that the quality of water is derived from its structure and polarity. This is influenced by magnetic resonances and other "subtle energy" resonances exposed to the water, which then are transferred into the water itself.

Even on the molecular level, water is very much an alive, animated substance. Oxygen and hydrogen form a solid body, yet an amazingly restless and excited mass. In every drop of water, electrical charges cause a never-ending colliding, joining and breaking apart of particles, (all at a rate of billions of such movements per second), as the water molecule perpetually fluctuates between the hexagonal and the spherical shape. This same "molecular dance" happens in all live water, whether within the cellular fluid or within the rainbow or storm cloud. The permanent striving for the spherical or pyramidal shape is caused by the unstable angle of 104.5 degrees, in which the hydrogen and oxygen atoms cling to each other. At a temperature below 0 Celsius, there is a tendency towards the hexagon shape, while above 0 degrees the tendency is towards the spherical shape of the water molecules. This results in a perpetual back-and-forth fluctuation of the structure or form of the molecule, at this difficult-to-imagine, very rapid pace, and therefore there will always be a vibration, "a never-ending, microscopic whirling dance" in all water. Consequently, researchers speak of the "open structure" of the water, a quality that allows it to comply with other elements and at the same time to dissolve them.

Water combines with almost everything it comes in contact with. Consequently, there is no such thing as "pure" water in nature. It is always "imprinted" by momentary contact with air, or contact with any surface or substance. It is influenced and changed by such, because of its innate "memory" - that is, water's ability to retain residual vibrations of all substances contacting that water. Beneficial physical properties are produced in the water by its exposure to beneficial vibrations such as sunlight. Solar radiation results in an acceleration of the vibration of the water molecules, as they absorb energised oxygen, CO₂ and warmth. Harmful frequencies from water's exposure to chemicals or heavy metals are left to linger in water after its contact with those harmful substances, even if such substances have been removed from the water through filtering, reverse osmosis, distillation, etc.

Through this vibrational 'memory effect', or 'magnetic resonance', information of a contaminant, including information of polarity is retained in the water molecule via its vibrations. This memory effect is sustained long after the disappearance of the contaminant from the water. The only known way of reversing this memory effect is through vibrational re-energising of the water. The direction of spin or rotation of the molecule itself is corrected, and its velocity can be accelerated in a dextrose or right-hand direction. We can say this also for any living thing, as all living things contain large percentages of water.

Electro-smog

Until recently, 'electro-smog' was not understood in its role in causing the desirable, complex molecular clusters in water to disassociate. Electro-smog is the result of the almost non-stop saturation of the atmosphere by man-made frequency transmissions – radar, satellites, short wave, medium wave, cellular phone transmitters – the list goes on. Most scientific analysts hold up machines not sufficiently sophisticated to detect the impact of these waveforms upon living organisms and conclude that electro-smog is not a major issue. Unfortunately, this is a 'machine to machine' reading (the impact of the output of one machine as registered on another machine), and this does not address the more subtle impacts of electro-smog. One should not use a thermometer to measure how tall one is, or

at least to draw a conclusion about one's height after taking one's temperature!

Magnetism

Magnetism simply means power and information (energy) that runs from one pole to another. The universe, life forms and all of creation is built upon this principle of positive (plus) and negative (minus) poles. There are three different types of magnetic forces known in the universe:

1. **Material Magnetism:** evident in iron's storage of permanent magnetism and in the North Pole / South Pole earth magnetism. This is a limited type of magnetism, related to a place, whereby only certain energy flow and therefore only particular materials (e.g. iron) can be attracted or repelled.
2. **Gravity Magnetism:** is related to space and time and involves various types of energy flow and the attraction of all materials.
3. **Planetary Magnetism:** (sometimes referred to as Scalar energy) the highest degree of magnetism, which governs the order of all creation in the universe, carrying information on life and heredity found in seeds, eggs and sperm cells; and planetary forces or energies such as of the sun or moon. This higher order of magnetism bears no relation to time or space, and programs all of Nature to absorb certain energies of information on life and heredity.

This controls, for example, the inevitable growth of a properly nurtured carrot seed into a carrot plant, such that this seed cannot become a turnip or any other type of plant. This planetary magnetism is related to the widely accepted energy humanity has named Life Force or Chi, or Prana - necessary for the existence of all life.

Different energies are produced through a combined action between the positive and negative of various magnetic forces. Energies are never actually generated, but rather simply transformed, through these combined and synergistic actions of the positive and negative polarities of the different magnetic forces explained above. This is why different matter emits different magnetic fields or magnetic resonances, or "vibrations". It is this principle that is used in the process of re-energising dead water.

To refer back to the statement "magnetism simply means power and information" (i.e. energy), what are the primary carriers of this energy to all matter? Water, of course. Water constantly transmits and receives the energies and information throughout all matter on or around the earth, indeed to all living things.

Similar to all living beings, the earth is made up of about 80% water. In the case of harmed or 'dead' water, the all-important energetic (magnetic/polarity) functions of water for the proper functioning of all life forms are rendered defective or sometimes nonexistent.

What is Damaged Water?

Damaged water is “dead” water; water that has had the health-giving and beneficial sub-molecular oscillations ("vibrations") removed from it through various forms of man's aggression, such as:

- Being forced through turbines at large reservoir exit points preceding the pipelines,
- Being forced through miles of straight, narrow, high-pressure pipes in an abnormal motion,
- Being poisoned through chlorination and other pollution, heavy metals, etc.
- Being bombarded with electro-smog.

The potent yet subtle energies that the natural, healthy water had incorporated into its physical structure through absorption of sunlight and moonlight and its exposure to beneficial underground magnetic fields are lost in the above processes. It is lost through friction, incompatible carrying processes, electro-smog and chemical poisoning. Unfortunately, due to the memory impairment sustained by all water, these losses of energy in damaged water are becoming cumulative, around the planet. When we add to this energy depletion problem the increasing load of countless pollutants on our sick water supplies, (including chlorine and other biocides killing the much-needed beneficial microbes) the end result is the chronic deterioration of the environment.

The above-mentioned "memory effect" phenomenon of water is observed on the molecular vibration level, as being present even in thoroughly or chemically cleansed water. We can keep scrubbing water with more chlorine, bromine, ozone, etc. Nevertheless, after such treatments, it is still "damaged water". It continues to bear and transfer residual sub-molecular information (sometimes called "subtle energy vibrational effect") from chemicals that were previously present in it, and oscillations from all the other impositions exerted upon it by our ‘modern’ infrastructures.

What can we do to restore this dead water? The answers have been coming to us from visionary naturalists and quantum scientists since the latter part of the last century, several of whom have discovered the nature of the processes that energised the water in its natural flows, (i.e. inwards, in a vortex fashion) and how to reinstate these energised, positive energies.

What is Re-energised Water?

In plain terms, the re-energisation of water simply restores its natural energies. Re-energised water is ‘spin’ restructured water, whereby the polarity of the water molecules and the contaminants are reversed. This will bring back the beneficial vibratory qualities of this water supply without actually filtering or removing harmful substances. The directional spin of the electrons determines polarity. Counterclockwise = positive polarity & clockwise = negative polarity.

Some of the properties of energised water are:

- Lowering of surface tension closer to that of cellular water (an indication of increased internal orderliness).
- The density also changes, and therefore the freezing and boiling points.
- The water becomes a more efficient carrier, delivering nutrients and bearing away wastes more efficiently from the systems of all living things.
- It is a better cleanser and does not irritate the skin as dead water often does.
- The flavour is always altered to a much more pleasant, fresh taste.
- The water appears clearer.
